"PCR amplification of amylin 3-34 from genomic DNA.";
Submitted (AUG-1996) to the EMBL/GenBank/DDBJ databases.
-I- FUNCTION: Selectively inhibits insulin-stimulated glucose
utilization and glycogen deposition in muscle, while not affecting
addipocyte glucose metabolism.
-I- SUBCELLULAR LOCATION: Secreted.

T "Role of $206 mutation of amylin gene in insulin secretion, insul

T sensitivity, and type II diabetes mellitus in Taiwanese patients.

Line of $206 mutation of amylin gene in insulin secretion, insul

T sensitivity, and type II diabetes mellitus in Taiwanese patients.

Line of $206 mutation of approximate the period deposition in muscle, while not affer utilization and glycogen deposition in muscle, while not affer adipocyte glucose metabolism.

C i SUBCELULAR LOCATION: Secreted.

C i DISABS: IAPP is the peptide subbnit of amyloid found in pancreatic islets of type 2 diabetic patients and in insulinc in sulling to the calcitonin family.

The pref. amylin analogues are given in AAR29197-222. Treating a patient deficient in adipose tissue comprises admin. of amylin or an analogue and/or insulin in an amt. and ratio sufficient to increase adipose tissue. Typical dosage units contain 0.1-10 mg of amylin analogue and 0.1-1 mg of insulin. (Updated on 25-MAR-2003 to correct PN field.)

The peptide is an analogue of human amylin which mimics the effects of the wild-type hormone. Preferred peptides are used in admixture with insulin for the treatment of diabetes mellitus or with glucagon for the treatment of hypoglycaemic conditions. See AAR37779 and AAR38809-R38826.                                    This invention describes a method for treating or preventing obesity human by administering amylin or amylin agonist. The method is used t reduce insulin-induced weight gain in human subjects taking insulin, patients with diabetes mellitus. Amylin or amylin agonist are administered subcutaneously 1-4 (especially 3) times/day at 30-300 (especially 60) mu g/dose. This peptide is a claimed example of an am
                                                                                                                                                        Method for treating or preventing obesity in human administering to subject amylin or amylin agonist, treating patients with diabetes mellitus.

                      This sequence represents a human amylin analogue, that acts as a amylin agonist. The invention relates to a liquid pharmaceutical formulation (A), that contains (wt./vol.): 0.01-0.5% amylin agonist (I); 1-10% carbohydrate or polyol (II); and 0.02-0.5% acetate, phosphate, citrate or glutamate buffer (III); and 0.02-0.5% acetate, phosphate, citrate or glutamate buffer (III); and has pH 3-6. (A) are used, in conjunction with insulin, for treatment of diabetes, specifically to reduce post-prandial increases in glucose levels of the blood. In these formulations, (I) is stabilised, especially against deamidation and peptide bond hydrolysis for up to 4 years at 5 degrees C and 30 days at 30 degrees C, without addition of a separate stabiliser. They also retain short-term (up to 24 hr) stability when combined with insulin, allowing both agents to be administered together, reducing the number of injections required. Note: This sequence was created by the indexer from information given in the specification

                                                                                                                                     cerebroventricularly. The specification describes a method for treating or preventing a condition for which a non-steroidal anti-inflammatory agent (NSAID) is indicated, comprising administering amylin or amylin agonist, which is not calcitonin, together with NSAID and also a composition comprising an amylin or an amylin agonist or their salts, except calcitonin and a NSAID in a carrier. The amylin composition is used to treat humans by administering it subcutaneously, intravenously or by nasal, oral, pulmonary, transdermal and buccal routes. The method is also used to treat pain, fever, inflammation, arthritis, hypercoagulation and other condition where an NSAID would be indicated. The present sequence is an example of an agonist used in the method
                                                                                                                                                                                                                                                                                                  This invention relates to a method for treating or preventing or gastric ulceration which comprises administering amylin or agonist. Amylin administration is not carried out intra-
                                                                                                               Sequence 37 AA;

                                                                                                                                                                                                                                                                                                            The present sequence represents an amylin agonist analogue compound. Amylin or amylin agonists are administered for reducing gastric motility or delaying gastric emptying, and for treating postprandial dumping syndrome or postprandial hyperglycenia, by inducing amylin activity, in a mammal. The peptides are used to reduce gastric motility or for delaying gastric emptying in a mammal undergoing gastrointestinal diagnostic procedures, such as radiological examination or magnetic resonance imaging. They are also used for reducing gastric motility in gastrointestinal disorder, especially spasm, which is associated with a disorder of acute diverticulitis or disorders of biliary tract or sphincter of oddi. They are also used to treat postprandial dumping syndrome or postprandial hyperglycemia
                                                                                                                                                                                                                                                                                      Sequence 37 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating gastrointestinal disorder e.g. spasm by reducing gastric motility or delaying gastric emptying, postprandial dumping syndrome or postprandial hyperglycemia, by administering amylin or amylin agonist.

                                                                                                                                                                                                             CC The package comprises a borosilicate glass vial having an open end, a compared of the vial and an aluminium band to retain the comparine with the amylin and/or amylin agonist compared in the open end of the vial. The package also comprises a comparine of the vial. The package also comprises a comparine of the vial. The package also comprises a comparine of the vial. The package also comprises a comparine of the treatment of patients with type II diabetes. The committed comprises amylin agonist which is biologically active, has a reduced tendency to form aggregates in water or at a pressure of greater chan 2 psi and has a reduced tendency to precipitate in the presence of CC macli compared to human amylin. The formulation maintains stability upon comparints in improved stability of the hormone and the patients no longer need to refrigerate the vial of insulin in use. The present sequence can be used as an amylin peptide analogue (called pramlintide), which can be used as an amylin agonist in the present invention. N.B. The compared the vial of the present sequence is not given in the present specification but is derived to compared the vial of the present specification but is derived to compare the vial of the present specification but is derived to compare the vial of the present specification but is derived to compare the vial of the present specification but is derived to compare the vial of the present specification but is derived to compare the vial of the present specification but is derived to compare the vial of the present specification but is derived to compare the present specification but is derived to the present specification 
                                                                                                          Matches
                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a liquid pharmaceutical formulation (A) comprising (wt/vol*) an amylin agonist (0.01 - 0.5), a carbohydrate or a polyhydric alcohol (1 - 10) and an acetate, phosphate, citrate or glutamate buffer (0.02 - 0.5) having a pH of 3 - 6. Also described is a commercial package containing the liquid pharmaceutical formulation (A).
                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a buffer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; amylin agonist; amylin peptide analogue; acetate; carbohydrate; liquid pharmaceutical formulation; polyhydric alcohol; phosphate; citrate; glutamate; buffer; antidiabetic; type II diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 1; Page; 19pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New pharmaceutical formulation useful for treating patients with type diabetes comprises amylin agonist, carbohydrate or polyhydric alcohol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      L'italien J, Musunuri

                                                                                               This invention relates to a novel albumin fusion protein having albumin CC or biological activity. Human serum albumin is responsible for a CC significant proportion of the osmotic pressure of serum and also CC functions as a carrier of endogenous and exogenous ligands. The fusion of CC albumin to a therapeutic protein may increase shelf-life and stability of CC the therapeutic protein. The albumin fusion protein of the invention may CC allow production of compositions with antidiabetic activity whilst the CC nucleotide sequence which encodes it may be useful for gene therapy. The CC diabetes mellitus. The present sequence is that of a therapeutic protein CC which was fused with human albumin to create a novel albumin fusion CC protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic CC format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences

The invention is useful for reducing gastric motility and delaying gastric motility and delaying gastric method for therapeutic and diagnostic purposes. The invention is also useful for treating conditions associated with elevated, inappropriate or undesired post-prandial blood glucose levels and treating ingestion of a toxin. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                Reducing gastric motility or delaying gastric emuseful for treating post-prandial hyperglycemia, an amylin or an amylin agonist.

                                                                                                                                                                                                                                                                                                                                                                    The invention relates to treating pancreatitis or in relieving pain caused by pancreatitis in a mammalian subject comprises administering to the subject an amount of an Amylin (a peptide hormone which inhibits insulin and glucagon secretion), Amylin analogue or an Amylin agonist, where the Amylin agonist is not calcitonin. Also included is a method of improving a treatment for pancreatitis in a mammalian subject. The Amylin analogue is 25,28,29Pro-h-amylin. The method further comprises administering to the subject an analgesic. The regime includes a low-fat diet. The methods are useful in treating pancreatitis or relieving pain caused by pancreatitis in a mammalian subject. The present sequence represents human Amylin analogue 25,28,29Pro-h-amylin. Note: The present sequence is not shown in the specification but was created by the indexer using the information in claim 9 and wild-type amylin (ADN16157).
Gastric motility; delay gastric emptying; amylin; agonist; postprandial dumping syndrome; postprandial hyperglycemia;
                                                                                                                                                                                                                                                                                                                                             Sequence 37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating pancreatitis or relieving pain caused by pancreatitis comprises administering to the subject an amylin, amylin analog or an amylin
                                            Human amylin agonist peptide analogue #1.

                                                                                                                                                                                                                                                                                                                                                                           The present invention is directed to novel methods for reducing gastric motility and delaying gastric emptying which comprises the administration of an amylin or an amylin agonist. The invention is useful for treating postprandial dumping syndrome, postprandial hyperglycemia and reducing gastric motility associated with gastrointestinal disorders such as spasm or delaying gastric emptying in a mammal undergoing a gastrointestinal disgnostic procedure such as radiological examination and magnetic resonance imaging. The invention is also useful for lowering postprandial blood glucose levels during treatment of diabetes. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises a pharmacoutical composition for transmucosal administration of a bioactive peptide/protein (e.g. exendin, PYY, GLP-1 or amylin peptide/protein) of interest. The composition of the invention is useful for the transmucosal administration of a bioactive peptide or protein and is useful for treating or preventing viral or bacterial diseases in humans. The present amino acid sequence represents an amylin peptide that is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO2005000222-A2

                      comprising at least one glucose regulating peptide (GRP) such as amylin, an amylin analog (such as pramlintide), glucagon-like peptide-1 (GLP)-1, exendin-3 or exendin-4 and one or more mucosal delivery-enhancing agents. The formulation or the method is useful for treating variety of diseases and conditions in mammalian subjects including obesity, hyperglycemia, dyslipidemia and diabbetes mellicus and for inducing satiety in an individual and to promote weight-loss in an individual. The invention is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises a pharmaceutical composition for transmucosal administration of a bioactive peptide/protein (e.g. exendin, PYY, GLP-1 or amylin peptide/protein) of interest. The composition of the invention is useful for the transmucosal administration of a bioactive peptide or protein and is useful for treating or preventing viral or bacterial diseases in humans. The present amino acid sequence represents an amylin peptide that is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical; weight loss; obesity; anorectic; nutritional disor hyperglycemia; antidiabetic; metabolic disorder; antilipemic; diabetes mellitus; metabolic disorder; glucose regulating peptide;
                                                                                                                                                                                                                                                                                                                                               New transmucosal glucose-regulating peptide (GRP) formulation, useful for treating e.g. obesity, hyperglycemia, dyslipidemia and diabetes mellitus and for inducing satiety in an individual and to promote weight-loss in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30-JUN-2005.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AEB17936

                                     The present invention relates to pharmaceutical compositions and methods comprising at least one glucose regulating peptide (GRP) such as amylin, an amylin analog (such as pramlintide), glucagon-like peptide-1 (GLP)-1, exendin-3 or exendin-4 and one or more mucosal delivery-enhancing agents. The formulation or the method is useful for treating variety of diseases and conditions in mammalian subjects including obseity, hyperglycemia, dyslipidemia and diabetes mellitus and for inducing satiety in an individual and to promote weight-loss in an individual. The invention is also useful in protein therapy. The present sequence is the human pramlintide peptide, which serves as an amylin agonist peptide. Note: The present sequence is the SEQ ID NO: 47 which is given in the sequence listing. This sequence differs from the SEQ ID NO:47 shown on page 6 of
                                                                                                                                                                                                                                                                                        New transmucosal glucose-regulating peptide (GRP) formulation, useful for treating e.g. obesity, hyperglycemia, dyslipidemia and diabetes mellitus and formulation satisty in an individual and to promote weight-loss in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical; weight loss; obesity; anorectic; nutritional disorder; hyperglycemia; antidiabetic; metabolic disorder; antilipemic; diabetes mellitus; metabolic disorder; glucose regulating peptide;

                                                                                                                                                                                   Treatment of a patient with anorexia or related condition comprises admin. of amylin or an analogue in an amt. sufficient to increase the amylin level in the plasma of the patient. The pref. amylin analogues are given in AAR29197-222. Treating a patient deficient in adipose tissue comprises admin. of amylin or an analogue and/or insulin in an amt. and ratio sufficient to increase adipose tissue. Typical dosage units contain 0.1-10 mg of amylin analogue and 0.1-1 mg of insulin. (Updated on 25-MAR-2003 to correct PN field.)

The pref, amylin analogues are given in AAR29197-222. Treating a patient deficient in adipose tissue comprises admin. of amylin or an analogue and/or insulin in an amt. and ratio sufficient to increase adipose tissue. Typical dosage units contain 0.1-10 mg of amylin analogue and 0.1-1 mg of insulin. (Updated on 25-MAR-2003 to correct PN field.)

The peptide is an analogue of human amylin which mimics the effects of the wild-type hormone. Preferred peptides are used in admixture with insulin for the treatment of diabetes mellitus or with glucagon for the treatment of hypoglycaemic conditions. See AAR37779 and AAR38809-R38826. The peptide is an analogue of human amylin which mimics the effects of the wild-type hormone. Preferred peptides are used in admixture with insulin for the treatment of diabetes mellitus or with glucagon for the treatment of hypoglycaemic conditions. See AAR37779 and AAR38809-R38826. The invention relates to a liquid pharmaceutical formulation (A), that contains (wt./vol.): 0.01-0.5% amylin agonist (I); 1-10% carbohydrate or polyol (II); and 0.02-0.5% acetate, phosphate, citrate or glutamate buffer (III); and has pH 3-6. (A) are used, in conjunction with insulin, for treatment of diabetes, specifically to reduce post-prandial increases in glucose levels of the blood. In these formulations, (I) is stabilised, especially against deamidation and peptide bond hydrolysis for up to 4 years at 5 degrees C and 30 days at 30 degrees C, without addition of a separate stabiliser. They also retain short-term (up to 24 hr) stability when combined with insulin, allowing both agents to be administered together, reducing the number of injections required. Note: This sequence was created by the indexer from information given in the

The invention relates to a liquid pharmaceutical formulation (A), that contains (wt./vol.): 0.01-0.5% amylin agonist (I); 1-10% carbohydrate or polyol (II); and 0.02-0.5% acetate, phosphate, citrate or glutamate buffer (III); and has pH 3-6. (A) are used, in conjunction with insulin, for treatment of diabetes, specifically to reduce post-prandial increases in glucose levels of the blood. In these formulations, (I) is stabilised, especially against deamidation and peptide bond hydrolysis for up to 4 years at 5 degrees C and 30 days at 30 degrees C, without addition of a separate stabiliser. They also retain short-term (up to 24 hr) stability when combined with insulin, allowing both agents to be administered together, reducing the number of injections required. Note:

           This invention relates to a method for treating or preventing gastrict or gastric ulceration which comprises administering amylin or an amylin administration is not carried out intraccerebroventricularly. The specification describes a method for treating or preventing a condition for which a non-steroidal anti-inflammatory agent (NSAID) is indicated, comprising and-mistering and also a composition shift is not calcitonin, together with NSAID and also a composition comprising an amylin agonist or their salts,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        or gastric ulceration which comprises administering amylin or an amylin agonist. Amylin administration is not carried out intracerebroventricularly. The specification describes a method for treating or preventing a condition for which a non-steroidal anti-inflammatory agent (NSAID) is indicated, comprising administering amylin or amylin agonist, which is not calcitonin, together with NSAID and also a composition comprising an amylin or an amylin agonist or their salts, except calcitonin and a NSAID in a carrier. The amylin composition is used to treat humans by administering it subcutaneously, intravenously or by nasal, oral, pulmonary, transdermal and buccal routes. The method is also used to treat pain, fever, inflammation, arthitis, hypercoagulation and other condition where an NSAID would be indicated. The present sequence is an example of an agonist used in the method
                                                                                                                                                              Claim 6;

                       The present sequence represents an amylin agonist analogue compound. Amylin or amylin agonists are administered for reducing gastric motility or delaying gastric emptying, and for treating postprandial dumping syndrome or postprandial hyperglycemia, by inducing amylin activity, in a mammal. The peptides are used to reduce gastric motility or for delaying gastric emptying in a mammal undergoing gastrointestinal diagnostic procedures, such as radiological examination or magnetic resonance imaging. They are also used for reducing gastric motility in gastrointestinal disorder, especially spasm, which is associated with a disorder of acute diverticulitis or disorders of biliary tract or sphincter of oddi. They are also used to treat postprandial dumping syndrome or postprandial hyperglycemia
                                                                                                                                                                                                                   Disclosure; Col 39-40; 50pp; English.
                                                                                                                                                                                                                                            Treating gastrointestinal disorder e.g. spasm by reducing gastric motility or delaying gastric emptying, postprandial dumping syndrome postprandial hyperglycemia, by administering amylin or amylin agonist

                                                                       The present sequence represents an amylin agonist analogue compound. Amylin or amylin agonists are administered for reducing gastric motility or delaying gastric emptying, and for treating postprandial dumping syndrome or postprandial hyperglycemia, by inducing amylin activity, in amammal. The peptides are used to reduce gastric motility or for delaying gastric emptying in a mammal undergoing gastrointestinal diagnostic procedures, such as radiological examination or magnetic resonance imaging. They are also used for reducing gastric motility in gastrointestinal disorder, especially spasm, which is associated with a disorder of acute diverticulitis or disorders of biliary tract or apphincter of oddi. They are also used to treat postprandial dumping evaluations or nestprandial humeroflycemia.

CC comprising (wt/vol*) an amylin agonist (0.01 - 0.5), a carbohydrate or a CC polyhydric alcohol (1 - 10) and an acetate, phosphate, citrate or a CC glutamate buffer (0.02 - 0.5) having a pH of 3 - 6. Also described is a CC commercial package containing the liquid pharmaceutical formulation (A). CC The package comprises a borosilicate glass vial having an open end, a ctopper for multiuse compatible with the amylin and/or amylin agonist CC fixed in the open end of the vial and an aluminium band to retain the carbohyer in the far end of the vial and an aluminium band to retain the carbohyer for use in a pen injector. (A) has antidiabetic activity and CC can be used in the treatment of patients with type II diabetes. The CC formulation comprises amylin agonist which is biologically active, has a creduced tendency to form aggregates in water or at a pressure of greater than 2 psi and has a reduced tendency to precipitate in the presence of CC NaCl compared to human amylin. The formulation maintains stability upon constorage under refrigerated or room-temperature conditions. The CC formulation retains short-term mixing compatibility with insulin and cresults in improved stability of the hormone and the patients no longer condition refrigerate the vial of insulin in use. The present sequence is not convenience of the present sequence is not convenience. The present sequence is not convenience in the present specification but is derived from the 37 amino acid comparing the invention. N.B. The present sequence is not convenience in the present specification but is derived from the 37 amino acid convenience.

CC comprising (wt/vol*) an amylin agonist (0.01 - 0.5), a carbohydrate or a comprising (wt/vol*) and amylin agonist (0.01 - 0.5), a carbohydrate or a cc polyhydric alcohol (1 - 10) and an acetate, phosphate, citrate or cc glutamate buffer (0.02 - 0.5) having a pH of 3 - 6. Also described is a ccommercial package contraining the liquid pharmaceutical formulation (A). CC The package comprises a borosilicate glass vial having an open end, a cc stopper for multiuse compatible with the amylin and/or amylin agonist cfixed in the open end of the vial and an aluminium band to retain the carbier in the far end of the vial and an aluminium band to retain the carbier for use in a pen injector. (A) has antidiabetic activity and cc artridge for use in a pen injector. (A) has antidiabetic activity and cc artridge for use in a pen injector. (A) has antidiabetic activity and cc reduced in the treatment of patients with type II diabetes. The cc are duced tendency to form aggregates in water or at a pressure of greater than 2 psi and has a reduced tendency to precipitate in the presence of cc wall compared to human amylin. The formulation maintains stability upon cc storage under refrigerate or room-temperature conditions. The formulation retains short-term mixing compatibility with insulin and camplin agonist in the present sequence as anylin agonist in the present invention. N.B. The present sequence is not camplin agonist in the present invention. N.B. The present sequence is not comparison in the present specification but is derived from the 37 amino acid to human amylin as stated in the invention.

Sequence 37 A

                                                                                                                                                                                                                                                                                                                                                          The present invention is directed to novel methods for reducing gastric motility and delaying gastric emptying, comprising the administration of an amylin agonist. The invention is useful for reducing gastric motility and delaying gastric emptying for therapeutic and diagnostic purposes. The invention is also useful for treating conditions associated with elevated, inappropriate or undesired post-prandial blood glucose levels and treating ingestion of a toxin. The present sequence is human amylin agonist analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reducing gastric motility or delaying gastric emuseful for treating post-prandial hyperglycemia, an amylin or an amylin agonist.

The invention is useful for reducing gastric motility and delaying gastric methying for therapeutic and diagnostic purposes. The invention is also useful for treating conditions associated with elevated, inappropriate or undesired post-prandial blood glucose levels and treating ingestion of a toxin. The present sequence is

                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention is directed to novel methods for reducing gastric motility and delaying gastric emptying which comprises the administration of an amylin or an amylin agonist. The invention is useful for treating postprandial dumping syndrome, postprandial hyperglycemia and reducing gastric motility associated with gastrointestinal disorders such as spasm or delaying gastric emptying in a mammal undergoing a gastrointestinal diagnostic procedure such as radiological examination and magnetic resonance imaging. The invention is also useful for lowering postprandial blood glucose levels during treatment of diabetes. The present sequence is human amylin agonist peptide analogue. This sequence is used in the

The invention is useful for treating postprandial dumping syndrome, postprandial hyperglycemia and reducing gastric motility associated with gastrointestinal disorders such as spasm or delaying gastric emptying in a mammal undergoing a gastrointestinal diagnostic procedure such as radiological examination and magnatic resonance imaging. The invention is also useful for lowering postprandial blood glucose levels during treatment of diabetes. The present sequence in manual maylin agonist peptide analogue. This sequence is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AEB17939,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AEB17939 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            administration of a bioactive peptide/protein (e.g. exendin, PYY, GLP-1 or amylin peptide/protein) of interest. The composition of the invention is useful for the transmucosal administration of a bioactive peptide or protein and is useful for treating or preventing viral or bacterial diseases in humans. The present amino acid sequence represents an amylin peptide that is used in the exemplification of the invention.
                                                                                                                                                                                          (NAST-)

The patent discloses a composition which can be used to reduce or consupress food intake, control appetite or control body weight in a compress food intake, control appetite or control body weight in a command, comprising an amylin agonist and a cholecystokinin (CCK) agonist cadmixed in a form suitable for therapeutic administration. Also disclosed are new hybrid peptides comprising an amylin agonist peptide and a CCK cagonist peptide covalently linked e.g. by the group -R1-R2-R3-R4-R5-CC where R1 = CONH(CH2)n, CCO(CH2)n or CO(CH2)n; R2 = COC(CH2)n, NHCO(CH2)n, CCO(CH2)n, CCC coccess or NH-X; R3 = CH2, CCC CCC CCC CCC coccess or NH-X; R3 = CH2, CF2, CCO, CS or CNH; R4 = O or NH; R5 ccc (CH2)nNHCO, (CH2)nOCO or (CH2)nCO; n = 1-6; and X = any amino acid conditional conditions of condition produces a greater effect than either administered alone; c.g. 0.1 microgram/kg of each peptide causes a substantial reduction of coccess conditions and cock agonists of food intake about equivalent to that seen with 100 microgram/kg of either coccess conditions and cock agonists of cock agonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exendin-3 or exendin-4 and one or more mucosal delivery-enhancing agents. The formulation or the method is useful for treating variety of diseases and conditions in mammalian subjects including obesity, hyperglycemia, dyslipidemia and diabetes mellitus and for inducing satiety in an individual and to promote weight-loss in an individual. The invention is also useful in protein therapy. The present sequence is the human pramilintide peptide, which serves as an amylin agonist peptide.

                                                                                                                                                                          Treatment of a patient with anorexia or related condition comprises admin. of amylin or an analogue in an amt. sufficient to increase the amylin level in the plasma of the patient. The pref. amylin analogues are given in AAR29197-222. Treating a patient deficient in adipose tissue comprises admin. of amylin or an analogue and/or insulin in an amt. and ratio sufficient to increase adipose tissue. Typical dosage units contain 0.1-10 mg of amylin analogue and 0.1-1 mg of insulin. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a liquid pharmaceutical formulation (A), that contains (wt./vol.): 0.01-0.5% amylin agonist (I); 1-10% carbohydrate or polyol (II); and 0.02-0.5% acetate, phosphate, citrate or glutamate buffer (III); and has pH 3-6. (A) are used, in conjunction with insulin, for treatment of diabetes, specifically to reduce post-prandial increases in glucose levels of the blood. In these formulations, (I) is stabilised, especially against deamidation and peptide bond hydrolysis for up to 4 years at 5 degrees C and 30 days at 30 degrees C, without addition of a separate stabiliser. They also retain short-term (up to 24 hr) stability when combined with insulin, allowing both agents to be administered together, reducing the number of injections required. Note: This sequence was created by the indexer from information given in the
       Amylin; human; agonist; gastritis; gastric ulceration; treatment; non-steroidal anti-inflammatory agent; NSAID; intravenous; subcutaneous; pain; fever; inflammation; arthritis; hypercoagulation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a method for treating or preventing gastritis or gastric ulceration which comprises administering amylin or an amylin agonist. Amylin administration is not carried out intraccerebroventricularly. The specification describes a method for treating or preventing a condition for which a non-steroidal anti-inflammatory agent (NSAID) is indicated, comprising administering anylin or amylin composition comprising an amylin together with NSAID and also a composition comprising an amylin or an amylin agonist or their salts, except calcitonin and a NSAID in a carrier. The amylin composition is used to treat humans by administering it subcutaneously, intravenously or by nasal, oral, pulmonary, transdermal and buccal routes. The method is also used to treat pain, fever, inflammation, arthritis, hypercoagulation and other condition where an NSAID would be indicated. The present sequence is an example of an agonist used in the method
                                                                                                              Amylin agonist; amylin; gastric motility; gastric emptying; postprandial dumping syndrome; postprandial hyperglycemia; gastrointestinal disorder; spasm; gastrointestinal disorder; spasm; acute diverticulitis; biliary tract disorder; sphincter of oddi disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 36 AA;

The peptides are used to reduce gastric motility or for delaying gastric emptying in a mammal undergoing gastrointestinal diagnostic procedures, such as radiological examination or magnetic resonance imaging. They are also used for reducing gastrointestinity in gastrointestinal disorder, especially spasm, which is associated with a disorder of acute diverticulitis or disorders of biliary tract or sphincter of oddi. They are also used to treat postprandial dumping syndrome or postprandial hyperglycemia

CThe present invention describes a liquid pharmaceutical formulation (A) comprising (wt/vol*) an amylin agonist (0.01 - 0.5), a carbohydrate or a comprising (wt/vol*) an amylin agonist (0.01 - 0.5), a carbohydrate or a comprising (wt/vol*) and an acetate, phosphate, citrate or a comprising package comprises a borosilicate glass vial having an open end, a stopper for multiuse compatible with the amylin and/or amylin aponist (A). CC glutamate buffer (0.02 - 0.5) having a pH of 3 - 6. Also described is a cc activate package comprises a borosilicate glass vial having an open end, a cc activate or a cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in a pen injector. (A) has antidiabetic activity and cartridge for use in appen in the presence of greater of defence tendency to precipitate in the presence of cartridge for use in a pen injector. (A) has antidiabetic activity upon storage under refrigerate of cartridge for use in the presence of cartridge for use in a pen inje
